

Value mappings

Value mapping concept allow you to replace values or ranges in your visualizations with words or emojis.

Values mapped via value mappings will skip the unit formatting. This means that a text value mapped to a numerical value will not be formatted using the configured unit.

Value mappings

	Condition		Display text	Color				
⋮	Special	Null	▼	N/A	●	×	📄	🗑️
⋮	Value	10		Perfection!	●	×	📄	🗑️
⋮	Range	From -10	To 4.9	Low	●	×	📄	🗑️
⋮	Range	From 15.1	To 100	High	●	×	📄	🗑️

+ Add a new mapping

CancelUpdate

If value mappings are present in a panel, then Grafana displays a summary in the side pane of the panel editor.

Note: The new value mappings are not compatible with some visualizations, such as Graph (old), Text, and Heatmap.

Value mapping examples

Value mappings are displayed differently in different visualizations.

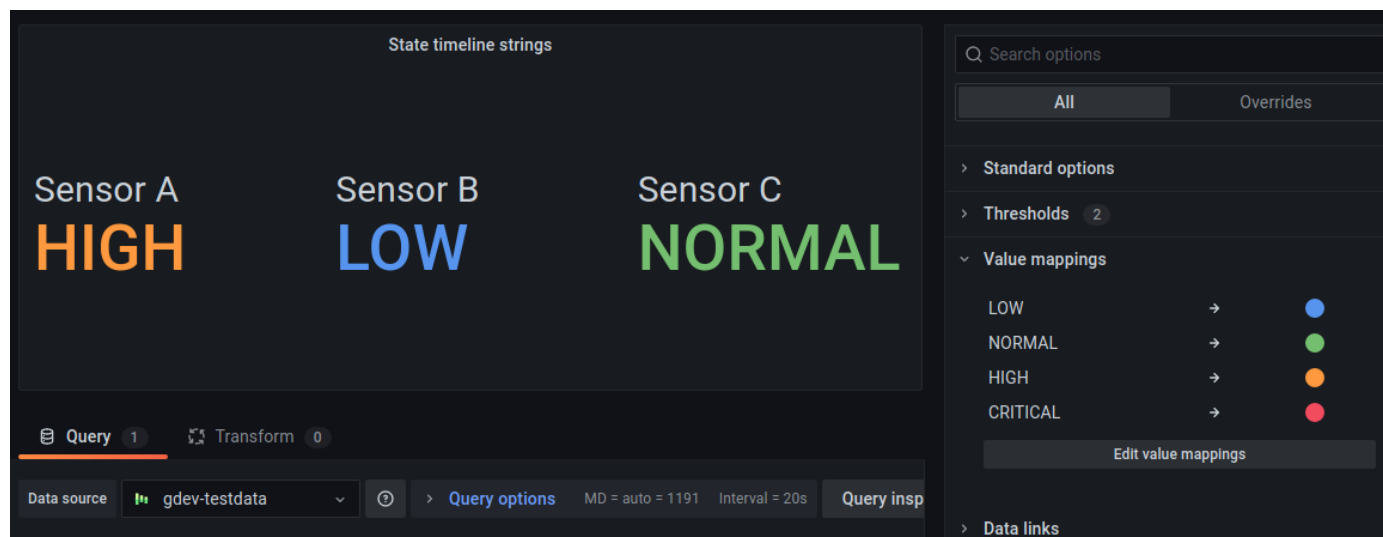

Time series example

Here's an example showing a Time series visualization with value mappings. Value mapping colors are not applied to this visualization, but the display text is shown on the axis.

Stat example

Here's an example showing a Stat visualization with value mappings. You might want to hide the sparkline so it doesn't interfere with the values. Value mapping text colors are applied.

Bar gauge example

Here's an example showing a Bar gauge visualization with value mappings. The value

mapping colors are applied to the text but not the gauges.

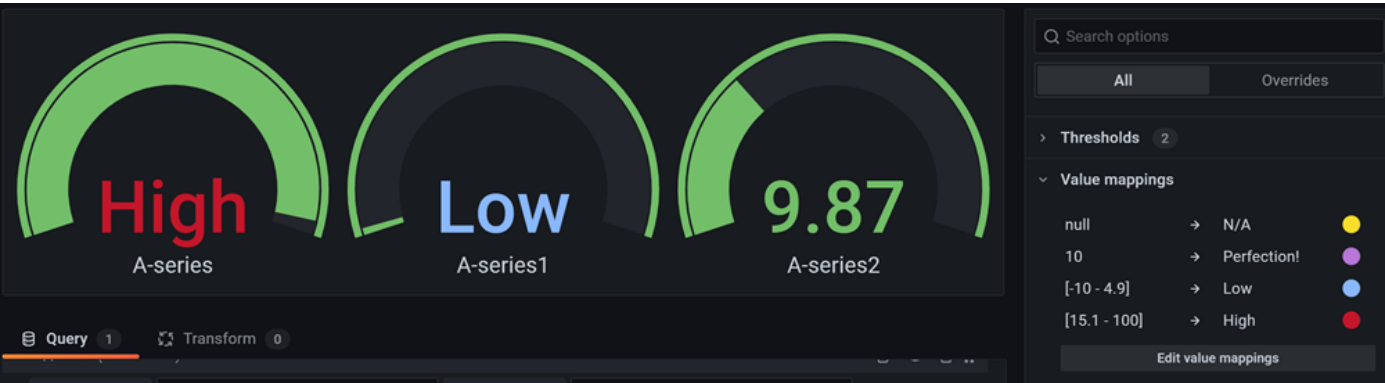

Table example

Here’s an example showing a Table visualization with value mappings. If you want value mapping colors displayed on the table, then set the cell display mode to **Color text** or **Color background**.

Table panel with value mapped colors			
time	Level A	Level B	Level C
Jun 2nd, 2021 00:56:11	LOW	NORMAL	NORMAL
Jun 2nd, 2021 01:36:11	HIGH	LOW	NORMAL
Jun 2nd, 2021 02:16:11	NORMAL	LOW	NORMAL
Jun 2nd, 2021 02:56:11	NORMAL	CRITICAL	NORMAL
Jun 2nd, 2021 03:36:11	NORMAL	CRITICAL	CRITICAL
Jun 2nd, 2021 04:16:11	LOW	LOW	LOW
Jun 2nd, 2021 04:56:11	LOW	LOW	NORMAL

A sidebar on the right shows 'Value mappings' for 'LOW' (blue), 'NORMAL' (green), 'HIGH' (orange), and 'CRITICAL' (red).

Value mappings fields

This section describes options in the Value mappings user interface.

Note: Display text and Color are both optional. If you want to only assign colors to the text values, then you can leave the display text empty and the original value is displayed.

Condition

This column lists the type of condition a value mapping is triggered by and the values.

You can map values to three different conditions:

- **Value** maps text values to a color or different display text. For example, if a value is `10`, I want Grafana to display **Perfection!** rather than the number.
- **Range** maps numerical ranges to a display text and color. For example, if a value is within a certain range, I want Grafana to display **Low** or **High** rather than the number.
- **Special** maps special values like `Null`, `NaN` (not a number), and boolean values like `true` and `false` to a display text and color. For example, if Grafana encounters a `null`, I want Grafana to display **N/A**.

You can also use the dots on the left as a “handle” to drag and reorder value mappings in the list.

Display text

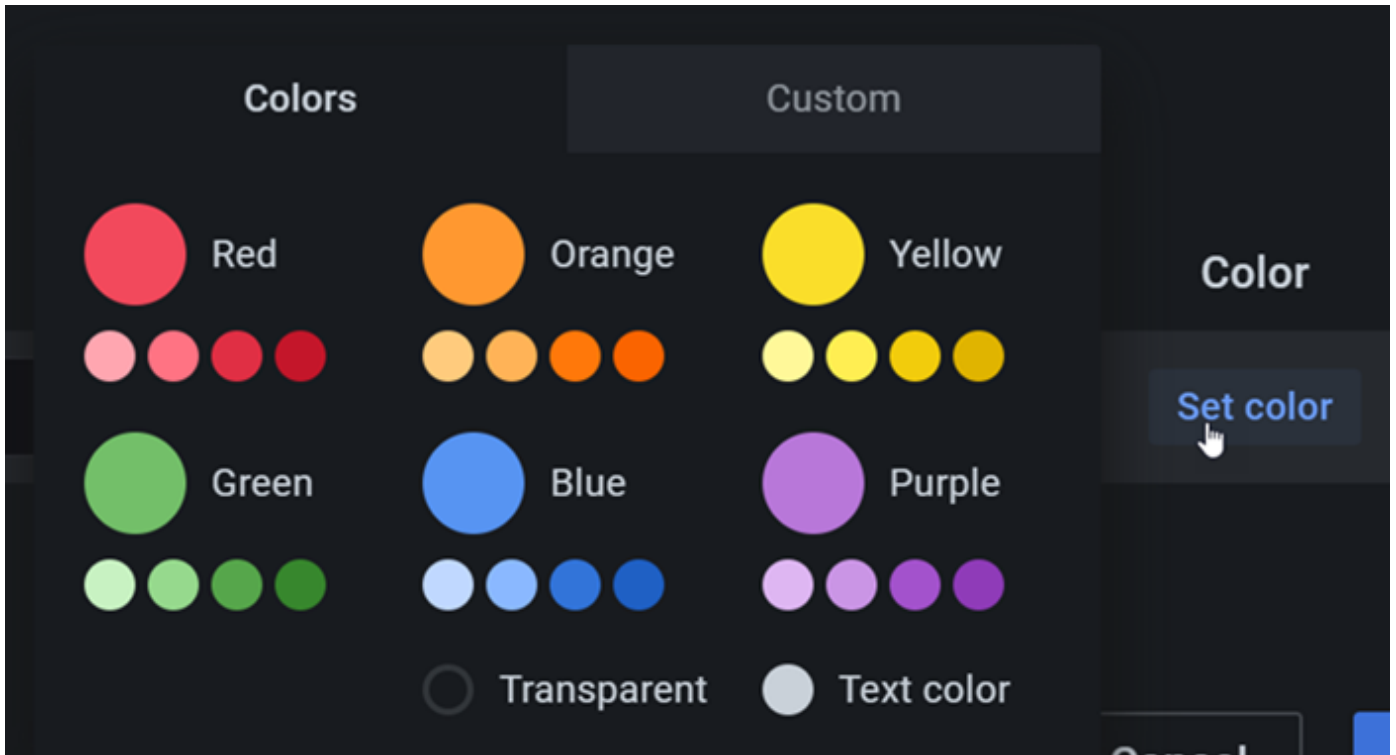

The *display text* is what Grafana displays instead of a number when the listed condition is met.

You can enter any Ascii character or emoji in this field.

Color

You can select a color to for Grafana to display the value mapping text in.

- **Set color** - Click **Set color** to see a range of recommended colors. Click **Custom** to choose your own color.
- **Text color** - The primary text color for the current theme, i.e. white in dark theme and black in light theme.
- **Transparent** - Makes the color transparent so that the value mapping color shows whatever color is behind it, such as a panel background color.

Copy icon

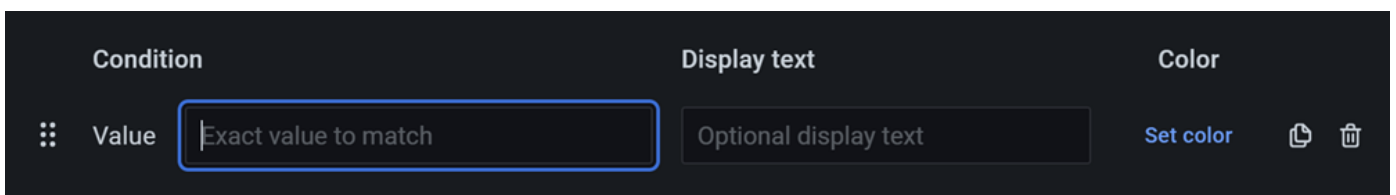

Click the copy icon in the value mapping row that you want to copy.

Trash icon

Click the trash can icon to delete a value mapping. Once deleted, you cannot recover it.

Map a value

Create a mapping for a single value.

1. [Open the panel editor.](#)
2. In the Value mappings section of the side pane, click **Add value mappings**.
3. Click **Add a new mapping** and then select **Value**.

4. Enter the value to match in the text field.
